Work of HTML

1. Defines the Page Layout

HTML creates the basic structure of the page, dividing it into different sections such as:

- Header (Top Bar)
- Sidebar (Navigation Menu)
- Main Content Area
- Login Form
- Optional Popups (Modals)

2. Creates the Navigation System

HTML is used to build the **sidebar menu**, which allows users to switch between sections like:

- Home
- Personal Info
- Reports
- Settings

These menu items are clickable and help users interact with the dashboard.

3. Forms for User Interaction

HTML forms are used for:

- **Login** (email, password, role selection)
- **Updating personal info**
- **Changing settings**

These forms allow users to input and submit data.

4. Display of Content Sections

HTML divides the content into multiple sections. Based on what the user clicks in the sidebar, a particular section (like reports or settings) becomes visible.

5. Search Functionality Interface

HTML provides a search bar and a button in the top bar, allowing users to enter search queries.

6. Login Interface

There is a dedicated login section with:

- Text fields
- Dropdown menu for role (admin/user)
- Checkbox for "Remember Me"
- Login button

It helps authenticate users before they access the dashboard.

7. Modals and Overlays

Although not fully used in your current version, HTML sets up the structure for **pop-up modals** and **overlay backgrounds**, which can be used for alerts or additional input forms in future features.
